Syntronic is a leading and global design house with more than 35 years of experience from working with development, production and aftermarket services and all related support during a product life cycle of embedded systems. We also have the capability to help our customers with integration, verification and production test development.

Telecom infrastructure equipment for wireless communication is one area of our expertise. We can also be your partner for development and life cycle support of equipment using 5G and IoT technology.

Syntronic Design Centres

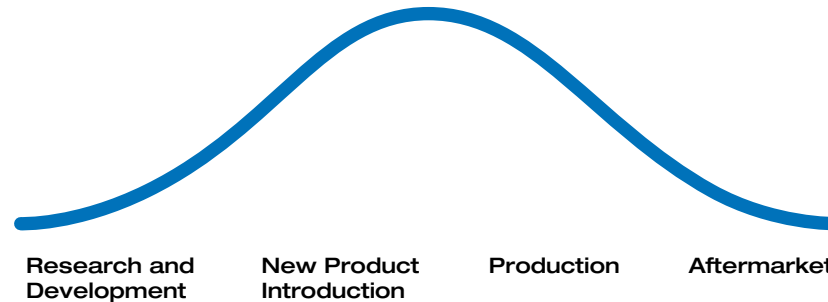

Our design centres have well-equipped labs with measurement and climate chambers and test equipment for advanced product development.

With our design centres we can offer local presence and at the same time give access to leverage on our capacity in low-cost regions.

Our offer

We can help our customers from the concept stage, or from any phase in the product life cycle, to released product, including production and aftermarket services. We have the knowledge and capacity to support on a global scale.

Product life cycle

Research and Development

System design, HW design (digital, analogue, radio/microwave, PCB layout), SW/FW development, FPGA/ASIC design, mechanical design, integration and verification, project and quality management.

New Product Introduction

Assurance of components, production test design, prototyping and pre-series, assembly fixtures, assurance of suppliers, machinery preparations, assurance of logistical flows, assure and develop tools for manufacturing.

Production

PCB assembly, cabling, enclosure, electromechanics, box build, project management, configuration management and well-defined supplier network.

Aftermarket

Repair centre, local upgrade centre, repair management service, product management support, spare part management, logistic solutions, consulting and global support.

Our business areas:

Telecom

Medtech

Industrial

Automotive
